Portfolio Website Documentation

Basma Hassan Fathy — AI & Data Portfolio

1. Project Overview

This project is a responsive personal portfolio website that presents the owner's profile, skills, selected projects, offered services, and contact links. It uses plain HTML, CSS, and JavaScript, so no build process or package installation is required.

2. Website Sections

- **Home:** Introductory headline, role, short value statement, and project/contact calls to action.
- **About Me:** Profile summary and current learning focus.
- **Skills:** AI & Machine Learning, Data Analysis, Generative AI & NLP, and Web Development.
- **Projects:** CodeLearn Platform, RAG Chatbot, and Image Classification.
- **Offered Services:** AI/ML, data analysis, RAG prototypes, and front-end development.
- **Contact:** Email, GitHub, LinkedIn, and location.

3. Technologies

HTML5 provides semantic structure; CSS3 provides responsive layout, styling, and mobile breakpoints; vanilla JavaScript controls the mobile navigation and automatically updates the footer year.

4. How to Run

1. Extract the downloaded ZIP archive.
2. Open the portfolio folder.
3. Open index.html in a modern browser, or open the folder in Visual Studio Code and run it with the Live Server extension.
4. No npm install or build command is needed.

5. How to Customize

Edit index.html to update biography, project descriptions, skills, services, and contact information. Edit style.css to adjust colors and visual styling. Edit script.js only if changing the menu behavior or footer logic. Replace contact links and add verified project repository/demo links before publishing.

6. Project Descriptions and Accuracy

The three project cards are based on the projects discussed: CodeLearn Platform, RAG Chatbot, and Image Classification. The RAG Chatbot and Image Classification projects have had local setup/debugging issues mentioned during development. Verify that upload, indexing, retrieval, and classification work as intended before describing those features as fully functional in a public portfolio.

7. Publishing

The site can be published as a static website using GitHub Pages, Netlify, or another static hosting provider. Before publishing, review all text, verify email/social links, add project screenshots only when available, and avoid publishing private information.

Files included: index.html • style.css • script.js • README.md • DOCUMENTATION.pdf
